

World first mobile biometrics console to be unveiled

Biometric Identity Management System (BIMS), the world's first mobile biometrics console, is to be unveiled for the first time at the connectID 2016 conference and expo at the Walter E. Washington Convention Center in Washington this week. BIMS enables biometric identification across a range of modalities - from fingerprint through to iris scanning - as well as being highly mobile and readily configurable. It can be rolled out rapidly in any environment requiring agile identification and processing of crowds.

It is capable of six biometric modalities and delivers a full range of connectivity options including Bluetooth, WiFi, GSM, GPS, LAN and cloud. Multi-functional and uniquely configurable, the unit has been designed to the world's most stringent hardware and software security standards, and harnesses intelligent power management for prolonged battery life of up to 12 hours.
